Home energy saving tips

Heating and cooling use the most energy in most homes. A programmable thermostat that lowers the temperature while you are asleep or away can cut the bill by around ten percent.

Seal air leaks around windows and doors with weatherstripping, and add insulation to the attic if it is thin. Replacing old bulbs with LEDs uses about a quarter of the electricity.

Wash clothes in cold water, run the dishwasher only when it is full, and unplug chargers and electronics that sit on standby all day.
